

AD Series
Air Driven Diaphragm Pumps

QUALITY PUMPS FOR ALL INDUSTRIES

Aquaplus pumps are a range of high quality industrial pumps designed specifically for Australian and international industries. Available through some of Australia's leading pump distributors, the Aquaplus range includes Centrifugal Self Priming, End Suction, Submersible, Chemical/Plastic, Peristaltic, Diaphragm, and Progressive Cavity Pumps.

The Aquaplus range is employed across many industries including mining, construction, water, sewerage & waste water, agriculture, petro-chemical, industrial, food and beverage and manufacturing.

If you are looking for a reliable, competitively priced pump that delivers results every time; then look no further than the Aquaplus pump range.

THE AQUAPLUS PRODUCT RANGE

Centrifugal Pumps

•	ES Series	End Suction Pumps
•	IP Series	Vertical Centrifugal Pumps
•	SD Series	Horizontal Split Case Pumps
•	MD Series	Magnetic Drive Pumps
•	DP Series	Submersible Drainage Pumps
•	SP Series	Submersible Clean Water Pumps
•	FP Series	Submersible Dirty Water Pumps
•	SS Series	Transfer Pumps

Positive Displacement Pumps

•	AD Series	Air Driven Diaphragm Pumps
•	RD Series	Mechanical Diaphragm Pumps
•	HP Series	Peristaltic Pumps
•	PC Series	Progressive Cavity Pumps

AD Series - Air Driven Diaphragm Pumps

OPERATING PRINCIPLE

Aquaplus double diaphragm pumps are operated by compressed air or any non-flammable compressed gas. The pumping stroke begins as air is delivered by the air distribution system, putting pressure on one diaphragm and then the opposite diaphragm. The two diaphragms are linked together by a common rod. The pumping stroke on one side is simultaneous with the suction stroke on the opposing diaphragm. This results in fluid being drawn from one side, while discharging fluid from the other side.

FEATURES

- Pumps anything that pours
- Wide range of pump types and sizes
- Patented lube-free air system
- Will not stall at slow speeds
- 100% tested prior to shipment
- Self-priming
- Non electrical
- Runs dry without damage
- Infinitely variable flow rate
- Intermittent operation or continuous duty
- Pumps fluids which contain particles
- Pumps high viscosity fluids
- Reduced solvent flash-off
- Simple modular design
- Dual manifold capability for 6mm to 25mm modules
- Parts interchangeability between models and sizes

PATENTED FREE, NON-STALLING AIR SYSTEM

The heart of the pump gives reliable, trouble-free operation in all sizes of pumps. Competitive pumps claim lube free operation, but operation manuals note that lubrication is always needed during 'certain operating conditions'. Aquaplus' air system

is truly lube-free and will not stall at slow speeds.

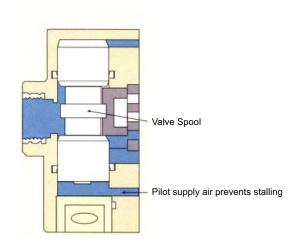

Lube free operation throughout the life of the pump is achieved by using dissimilar plastic materials within the air system and shuttle mechanism constructed of lubrication filled materials to maximize lubricity. Flatness and surface finishes are held to strict engineering tolerances which also reduce the coefficient of friction resulting in trouble-free operation and increased air efficiency.

No air is lost when fluid discharge lines are closed. The air system seals completely and prevents air consumption when the pump is not transferring fluid. The low coefficient of friction between the air system components also helps reduce air consumption.

All plastic air systems used in both metallic and plastic pumps are corrosion resistant and will not be destroyed in case of diaphragm rupture, spills or corrosive atmospheres.

State of the art seal technology used in the air system is more tolerant of dirty and wet air supplies. Lip seals and high wear elastomers offer outstanding cycle life.

Stalling is prevented as the pilot supply air maintains a constant pressure against the air valve spool throughout the discharge stroke preventing the spool/shuttle combination from moving into a neutral or stall position. Aquaplus pumps do not require reset buttons or magnets to ensure continuous pump operation – only air.

NO STALLOUTS DUE TO FREEZING

Stallout due to ice formation in the air system is virtually eliminated due to the insulating quality of all plastic construction plus the ability to slow air expansion and velocity without compromising performance.

NO VENT HOLES

There are no vent holes in the air valve. Vent holes needed to prevent stalling in competitive pumps allow corrosive fumes to enter and destroy valuable components. Additionally, if a diaphragm pump ruptures, fluid leakage cannot be routed to a safe containment zone. The sealed air valve allows containment of fluid and prevents fumes from entering air system.

BOLTED OR BAND CLAMP CONSTRUCTION

The 6mm, 10mm, 40mm, 50mm and the 80mm are available in bolted design only. The 15mm and 25mm are available in clamped and bolted designs.

PERFORMANCE ENGINEERED PTFE DESIGN

Superior PTFE overlay design does not require reduced diaphragm rod stoke, which in turn reduces pump capacity by 20%. All back-up diaphragms for PTFE overlays are Santoprene® which offers a chemically resistant 'second line of defence'.

THERMOPLASTIC DIAPHRAGMS

The thermoplastic diaphragms offer superior chemical abrasion resistance and increased cycle life. The wide range of applications that these materials can address also make ordering the correct pump much easier.

MAINTENANCE TIME IS REDUCED

Due to uniform product design maintenance time is reduced. All models share the same design concept from 15mm pumps to 80mm pumps. The size of the components just becomes larger. If you know how to rebuild one size you can easily rebuild any size.

INVENTORY IS REDUCED

Metallic and plastic pumps all share the same air systems, diaphragms, O-Rings, balls and in some cases valve seats, which helps to reduce inventory requirements. To further help minimise inventory requirements, 40mm and 50mm models share the same air systems, diaphragms and valve seat components.

ALL PLASTIC AIR SYSTEMS

There are all plastic air systems in both metallic and plastic pumps preventing destruction of air system components from corrosive atmospheres or diaphragm ruptures. No brass or aluminium components are used within the air systems.

SIMPLE ORDERING CODES

Are you confused by the complex ordering codes, required by some manufacturers? Not with Aquaplus, as all our models are easily associated with materials and have a simplified model number as shown on page 6.

FLANGE FITTINGS OR THREADED FITTINGS

The Aquaplus 25mm plastic bolted, 40mm and 50mm plastic and metal pumps are built with flange fittings that reduce installation and service time. Threaded pipe connections may be ordered for the 50mm aluminium pumps.

LARGER CAPACITY

Larger capacity per stroke than competitive models means less wear on moving parts.

BSP COMPATIBILITY

BSP compatibility is accomplished through the use of slotted flanges on the 25mm, 40mm and 50mm models and BSP compatible threads are available on other models when requested.

ATEX AND CE

Certification and quality control procedures have been obtained for all models.

- All air systems are glass-filled polypropylene.

Product Guide

PB Model

The PB Model is the most economical choice for all nonaggressive, water-based liquids and slurries. Water-based inks, paints, adhesives and ceramic slurries are some common applications. Polypropylene offers excellent abrasion resistance and zero water absorption.

PT Model

The PT Model is often used in corrosive environments, inorganic acids, bases, plating solutions, alcohols and most water-soluble chemicals. The 25mm and larger polypropylene pumps have fiberglass reinforcement for structural integrity. Do not use with hydrofluoric acid or other fluids not recommended for use with fiberglass.

KT Model

The KT Model has excellent mechanical properties and is able to handle a wide range of chemicals such as strong acids and bases, phenols.

AB Model

The AB Model contains aluminium that is an A380 class material that does not require anodising impregnation or painting for appearance or wear characteristics. Do not use aluminium with halogenated solvents.

SP Model

The SP model as with the PT model is often used in a corrosive environment where a big stainless steel pump is preferred. Generally used for acidic based products but caution must be taken to ensure suitability.

NOTES

- Always check chemical resistance guide for compatibility.
- Do not use aluminium with halogenated solvents.

DIAPHRAGM NOTES

Geolast[®] is nitrile based thermoplastic elastomer used in place of nitrile (Buna-N) or Neoprene for non-aggressive water based applications.

Santoprene® is an EPDM-based thermoplastic elastomer and is resistant to mild acids, some solvents and bases.

Both Geolast® and Santoprene® offer superior cycle life over cloth reinforced diaphragms, abrasion resistance and extended chemical resistance.

PTFE – stock models feature a two part diaphragm system. Bonded single piece diaphragms are available on 25mm models only.

Santoprene® and Geolast® are registered trademarks of Advanced Elastomer Systems.

Teflon® and Viton® are registered trademarks of DuPont Dow Elastomers.

DRUM KITS

Drum pump kits are available for 6mm, 15mm and 25mm plastic and 15mm metallic pumps.

The pumps are supplied with bung adaptor and suction tube. Manifolds are pre-positioned for immediate assembly.

PROCESS CONTROL FOR AQUAPLUS PUMPS

CYCLE COUNTING

Every time a cycle is completed, an impulse is sent from the cycle count valve to a data acquisition centre for automated input to a PC, PLC, relay or switch. Measuring how much fluid is being transferred through the pump based on the number of elapsed cycles is a convenient method for:

- 1. monitoring how much additive a system has received or
- adding a precise dose of clued based on a set number of cycles. Cycle based maintenance rather than time interval maintenance is ideal for systems where the fluid is hazardous of abrasive. Elapsed cycles can be monitored from any workstation within a network.

The cycle count valve is integral to the air valve. The sensor at the bottom of the air valve is provided (see photo). The configuration for data acquisition and control is not provided.

To order a pump with the cycle count valve assembled on the pump, add Option Code – A42 to the pump model number.

DRUM KITS

The many advantages of diaphragm pumps make them ideal for drum evacuation. When ordering an Aquaplus pump with a drum mounting kit, the bottom port is positioned for immediate assembly, and a universal bung adaptor and compatible suction tube are provided. All the components necessary for the perfect drum pump!

Add a 'D' after the model code (e.g. PED-05) to receive the drum configuration. Drum mounting kits are available for pumps up to 25mm in size. Contact your Aquaplus distributor for compatible pump models.

SOLENOID CONTROL

(Optional for Specialty Performance & Performance Plus)

The solenoid control valve is used for remote, electrical control of an Aquaplus pump through a PC, PLC, relay or switch. The solenoid control valve can be operated from any workstation in a network.

The solenoid control valve replaces the air valve assembly. The solenoid is mounted onto the intermediate using an adaptor plate. When energized, air is delivered to one side of the pump while simoultaneously exhausting the other side. The reverse occurs when

the valve is de-energised.

World standard connections and coil voltage are available. The control signal is a solution to 'on demand' fluid transfer requirements or the pump can be used to monitor flow rate.

To order the solenoid control valve, add-A43-XX to the model number with the voltage requirement replacing 'XX'..

Both the Cycle Counter and Solenoid control valves are designed to make your Aquaplus pump an integral component of your process. Chemical, ink, paint pigment and adhesive transfer are just a few of the literally thousands of applications requiring process control.

Note: The cycle count solenoid control valves can be used on pumps 10mm and larger. Contact your Aquaplus distributor for pricing and application information.

Pump Selection and Installation Guide

READING THE PUMP CURVE

You must know the following data:

- 1. Required discharge pressure.
- 2. Air pressure available at the air inlet of the pump.
- 3. Required flow rate.

To obtain discharge pressure

Using the performance chart for a 15mm pump shown: If 5.4bar is available at the air inlet and the required capacity of the pump is 22.8L/min. Follow the blue concave curve at 5.4bar as it slopes to the right and intersects with the 22.8L/min vertical line. By tracking horizontally back to the left (Y) axis, the discharge pressure is ascertained – 4.4bar 3.

Reverse the steps above:

Choose required discharge pressure 4.4bar ② On left (Y) axis, go directly across the graph to the intersection of the correct flow rate 22.8L/min ② then track up and back toward the left (Y) axis along the blue curve; and the correct required air pressure can be obtained (5.4 bar) ①

Note: If greater outlet pressure vs. air inlet pressure is required select a larger pump.

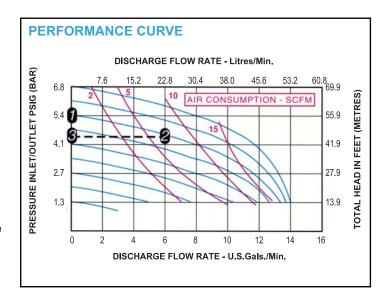

To obtain air consumption

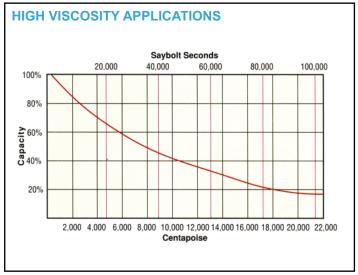

The convex red lines represent the air consumption (standard cubic feet per minute), and the closest red line to where the blue line and the flow rate intersect ② represents the air capacity required. On our example the air consumption would be approximately 6SCFM.

Note: To Convert SCFM to m³/h (N) multiply by 1.7.

INSTALLATION

- A lube-free, clean, dry compressed air source (or any nonflammable, compressed gas) is recommended. Use a filter that is capable of filtering out particles larger than 50 microns.
- Pumps should be mounted in an upright position with the exception of the 6mm models which may be rotated 360° to suit the application.
- Install a particle fluid filter on the fluid suction line when particles in the fluid exceed the maximum particle size specifications of the pump or particles are sharp enough to cut the diaphragms.
- 4. Never restrict fluid suction lines by means of a reduced pipe size (smaller than pump inlet size) or control the pump with valves on the fluid inlet side of the pump.
- 5. Limit fluid inlet pressure to 0.68bar.

As you can see from the diagram above, as viscosities increase, the capacity of the pump decreases. Do not exceed 22,000 centapoise or 100,000 saybolt seconds on all 6mm to 80mm models. Do not exceed 4,000 centapose or 18,000 saybolt seconds on 6mm models.

Some points to remember when pumping high viscosities:

- Position the pump close to or below the level of the fluid source.
- Suction lines should be increased in size-up to three times the size of the pump manifold inlet. Dual manifolds may be used when available.
- 3. Start the pump slowly using a control valve on the air line.
- 4. Maximum air pressure required is reached when increasing the air pressure does not increase the flow rate.
- 5. If greater capacity is required, select a large pump.

Notes

AVAILABLE FROM
